PROFESSIONAL SUMMARY

Computer Engineer with a Master's Degree in Computer Engineering and Networks and a Bachelor's Degree in Informatics Engineering from Universitat Politècnica de València. I focus on backend development, cloud infrastructure, and maintainable system design. I enjoy turning real product needs into robust, well-engineered solutions while continuing to learn and explore new technologies.

EDUCATION

- **Master's Degree in Computer and Network Engineering** september 2025 - july 2026
Universitat Politècnica de València average grade 9.0
- **Computer Engineering** september 2021 - july 2025
Universitat Politècnica de València average grade 8.6

LANGUAGES

Spanish - Native
English - Professional Competence

PROFESSIONAL EXPERIENCE

- **Internship at the DISCA Department, UPV** october 2024 - july 2025
Universitat Politècnica de València
 - Developed a computer vision system to detect defects in industrial objects from images, covering data preparation, model training and result validation with Python and YOLO.
 - Trained and evaluated models with Ultralytics, tuning the inference workflow for NVIDIA Jetson hardware with TensorRT and deployment in low-power environments.
- **Internship at SOLTECSIS S.L.** july 2024
SOLTECSIS S.L.
 - Debugged and fixed issues during the migration of the open-source FWCloud project from JavaScript to TypeScript, working on existing modules and reviewing behavior affected by typing.
 - Collaborated on codebase refactoring to improve maintainability, readability and type safety, following the project structure and team reviews.

PERSONAL AND STUDENT PROJECTS

- **Url Shortener** **View website** March 2026
Personal Project
 - Technologies: React, Go, PostgreSQL, Docker, Google Cloud.
 - Developed a full-stack application to create, store and manage shortened URLs, designing the user flow and communication between frontend, API and database.
 - Implemented the React frontend, Go backend, PostgreSQL persistence, Docker containerization and Google Cloud deployment, prioritizing a simple and maintainable architecture.
- **Safe Art - IoT Sensorization** January 2026
Project for the RISA course (Sensor and Actuator Networks)
 - Technologies: TypeScript, Convex, MQTT, C++, React.
 - Developed an IoT system to monitor and protect artworks using sensors, MQTT communication and a platform focused on alerts and real-time data.
 - Implemented sensor logic in C++ and a React web platform to visualize measurements, inspect system status and manage alerts from the interface.
- **Defect detection in objects using convolutional neural networks** October 2024 - June 2025
Final Degree Project in Computer Engineering.
 - Technologies: Python, Computer Vision, CNN, YOLO, Ultralytics, TensorRT, NVIDIA Jetson.
 - Developed a real-time defect detection system for industrial product images, comparing YOLO models and optimizing inference on low-power hardware.
